

Fibonacci-type Sequences

- This is part of a Fibonacci-type sequence where each number is the sum of the two previous numbers.

This is part of another Fibonacci-type sequence.

This is part of another Fibonacci-type sequence

- and so is

Investigate the possible 'end' numbers for parts of Fibonacci-type sequences.

Leonardo Fibonacci

Leonardo Fibonacci was born about 1175 in Pisa, which was a commercial centre of Italy. His father was a merchant, which probably accounted for Leonardo's early interest in arithmetic. Trips to Egypt, Sicily, Greece and Syria brought him into contact with Eastern and Arabic mathematics and Fibonacci became thoroughly convinced of the practical superiority of the Hindu-Arabic methods of calculation. In 1202 he published his famous work *Liber abaci*. This book strongly advocated the Hindu-Arabic notation and did much to encourage the introduction of these numerals into Europe. Fibonacci published two other important books: *Practica geometicae* in 1220 and *Liber quadratorum* in 1225.
